

# Schema

**John Nadasky**

## Schema

A Schema defines structured, physical data as tables. A Schema can include join relationships to other tables, including alias tables and materialized views, as well as tables in other Schema.

To view available Schemas, in the Navigation bar, select the Schema tab. In Schema, in the Action bar you can:

- Create Schema
- Schema Wizard
- Import Schemas

- Create a Session Variable of the type External Variable, Internal Variable, or Filter Expression
- Create Global Variables

The sub-tabs allow you to navigate between both Schemas, Session Variables, and Global Variables .

In the Context bar, use Search to narrow the list of Schemas, Session Variables, or Global Variables. You can export and delete selected schemas.

For a given schema, use the More Options menu to:

- Edit Description
- Performance Optimization
- Change Load Order
- Schedule
- Export
- Delete
- Share
- Create Email Notification
