

# Data

**John Nadasky**

To start using Incorta as a modern data analytics and data warehouse platform, Incorta must extract and load structured data from a Data Source or Data File.

## Data Source

A Data Source is a connection to a database, data warehouse, software-as-service API, file share service, HTTP endpoint, or similar data storage or data application.

## Data File

A Data File is a structured data file such as a Tab Separated Value file(.tsv), Comma Separated Value file (.csv), Microsoft Excel file (.xsl, xslx), or custom delimited file (.txt).

In the Data tab, you can add and manage:

- Data Sources
- Data Files

## Data Destinations

A data destination is an object that enables the seamless export of one or more insights to Google Drive or Google Sheets.

File types that can be used in each of these destinations are:

Google Drive: CSV and Excel files

Google Sheets: Google sheets only
